

Status of Analysis of Beam Dump Triggered by Fast Losses on 25-08-2010 @ 08:03

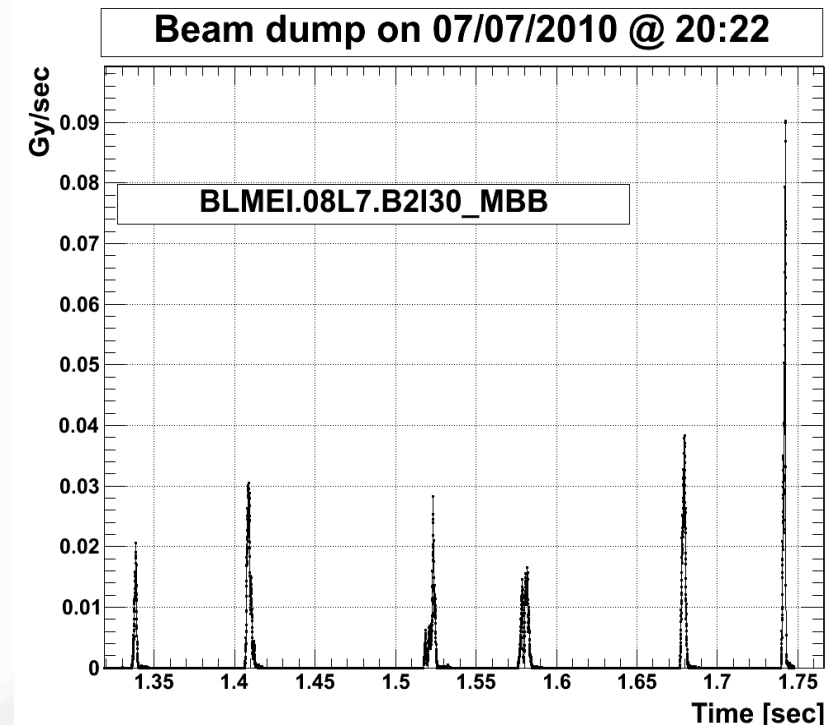

A. Nordt

Collimation WG meeting 30th of August 2010

Choose longer BLM PM buffer for analysis
 This allows to check for losses before the beam dump

PM application:
 BLM data of 0.082 sec

Longer PM buffer:
 BLM data of 1.72 sec

Example Event 1: One can see 5 times higher losses before the beam dump event in the long PM buffer data instead of only once from the application data.
